Drawings

1. Figures 6, 7, and 11, should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). Corrected drawings in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. The replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Allowable Subject Matter

2. Claims 1-8 are allowed.

3. The following is an examiner's statement of reasons for allowance:

This application is allowed, because the prior art fails to disclose the present invention.

The prior art provides positioning control methods wherein a driver drives a table holding a workpiece and moves in predetermined direction (X-Y); wherein

measurements are provided for the displacement of the driver and the position of the table on a base. The prior art further provides positioning the table to a target signal

using the displacement signal. However, the prior art does not teach a method of using a motor transfer function, a table transfer function, and a base driving transfer function;

and specifically the base driving transfer function. While the prior art does provide using transfer functions in relation to the motor and table, the prior art fails to teach the

method of the present invention. Specifically the prior art fails to teach the limitations of the vibration model having: motor transfer function generating motor displacement from an input that is the sum of input torque and a table propelling force multiplied with a reducer and Cartesian-to-polar coordinate transformation constant; table transfer function multiplying deviation between an output that is said motor displacement multiplied with reducer and polar-to-Cartesian coordinate transformation constant and table displacement with table-displacement-to-force conversion spring constant to generate said table propelling force and to output table displacement from said table propelling force; a base driving transfer function for generating displacement base displacement by multiplying the base with a base-displacement-to-force conversion spring coefficient and inputting the same with said table propelling force, table displacement being generated from a difference between said table displacement and said base displacement. For these reasons, this application is allowed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. (See PTO form 892).
